Easy Read Information

What you need to know about the

**Combined Contraceptive Pill**

The contraceptive pill is taken by a woman to reduce her chances of getting pregnant.
This is a pill you swallow.

When you start your pill, for the first time only you take your pill on the first day of your period.

You take 1 pill every day for 21 days.

Stop taking pill for the next 7 days.

You must take the pill at the same time every day.

If you are more than a day late in taking your pill or starting your new packet, then you should contact your doctor or nurse.

You should always talk to a doctor or nurse and they can help you decide if the pill is right for you.
Do not worry if your period is lighter than usual or if there is no bleeding – this is normal.

A few women have mood changes, headaches and sore boobs (breasts) at first.

After a few months these normally settle.

You need to tell the nurse or doctor if you have any vomiting or diarrhoea as this can stop the pill from working.
It is important to tell the doctor, nurse or pharmacist you are taking the contraceptive pill.

Some medications can stop the pill from working.

**Good things about the pill are:**

- It is easy to use
- It works well
- It can help with heavy bleeding and pain when you have your period.

**The pill may not be okay for you if:**

- You smoke and are over 35 years old
- You have certain illnesses
- You are not good at remembering to take your pill
Remember
The pill will not protect you from sexually transmitted infections.

Use condoms when having sex.
